

1. Add Flathub

```
flatpak remote-add --if-not-exists flathub \
  https://flathub.org/repo/flathub.flatpakrepo
```

Verify:

```
flatpak remotes
```

You should see *flathub*.

2. Install the Freedesktop runtime + SDK

For LocalPDF Studio:

```
flatpak install flathub \
  org.freedesktop.Platform//25.08 \
  org.freedesktop.Sdk//25.08
```

And the Electron base app:

```
flatpak install flathub \
  org.electronjs.Electron2.BaseApp//25.08
```

3. Confirm everything is in place

```
flatpak list --runtime
```

You should now see something like:

```
org.freedesktop.Platform      25.08
org.freedesktop.Sdk           25.08
```

And run this:

```
flatpak list | grep Electron
```

You should see something like:

```
Electron2 application base    org.electronjs.Electron2.BaseApp
25.08
```

4. Now run this command to install flatpak builder:

```
sudo apt install flatpak-builder
```

5. Now build and install the flatpak locally on your device:

```
flatpak-builder --user --install --force-clean build-dir
com.localpdfstudio.app.yml
```

6. Test all the files related to the flatpak:

```
flatpak-builder --run build-dir com.localpdfstudio.app.yml  
appstreamcli validate  
/app/share/metainfo/com.localpdfstudio.app.metainfo.xml
```

7. Run the app:

```
flatpak run com.localpdfstudio.app
```

8. Uninstall the app:

```
flatpak uninstall com.localpdfstudio.app
```
